CCNA 200-301 Quick Reference

1 Layer 1 Standards

1.1 ANSI/TIA T568 Pinout Standards

Pin	T568A	T568B	MDI	MDI-X
1	**Green-White**	**Orange-White**	Tx	Rx
2	**Green**	**Orange**	Tx	Rx
3	**Orange-White**	**Green-White**	Rx	Tx
4	**Blue**	**Blue**		
5	**Blue-White**	**Blue-White**		
6	**Orange**	**Green**	Rx	Tx
7	**Brown-White**	**Brown-White**		
8	**Brown**	**Brown**		

Two standard T568 pinouts exist for the *Medium-Dependent Interface* (MDI) and *MDI Crossover* (MDI-X) port standards. Computers, routers, and Layer 3 devices use the MDI standard; switches, hubs, and other Layer 2 devices use the MDI-X standard. Connections between MDI and MDI-X ports use a *straight-through* cable, where the same T568 standard terminates each end of the cable. Connections between two MDI (or two MDI-X) ports use a *crossover* cable, where different T568 standards terminate each end of the cable. Most new equipment incorporates *Auto-MDIX* circuitry to allow either cable type.

Note: The T568B standard is more commonly used for straight-through cables in North America.

1.2 Cabling Standards

Table 1.1: IEEE 802.3 Copper Standards

802.3i	10BASE-T	10 Mbps	CAT3
802.3u	100BASE-TX	100 Mbps	CAT5
802.3ab	1000BASE-T	1 Gbps	CAT5e
802.3z	1000BASE-SX 1000BASE-LX	1 Gbps	550m Fiber 5km Fiber
802.3an	10GBASE-T	10 Gbps	CAT6a
802.3ba	40GBASE-T	40 Gbps	CAT8
802.3bz	2.5GBASE-T 5GBASE-T	2.5 Gbps 5 Gbps	CAT5e CAT5e

Table 1.2: SFP Transceivers

SX SR	MMF 850 nm **black**	550 m 300 m
LX/LR	SMF 1310 nm **blue**	10-20 km
—	SMF 1490 nm **violet**	—
EX/ER ZX/ZR	SMF 1550 nm **yellow**	40 km 80 km

Table 1.3: ANSI/TIA-598 Fiber Standards

Type	Polish	Jacket/Connector	Usage
OS1/OS2	UPC	**yellow/blue**	indoor/outdoor
	APC	**yellow/green**	
OM1	UPC	**orange/beige** **orange/gray**	100 Mbps
OM2	UPC	**orange/black**	1 Gbps
OM3/OM4	UPC	**aqua/aqua**	10/40/100 Gbps
OM5	UPC	**lime/lime**	10/40/100 Gbps

Table 1.4: Power over Ethernet (PoE)

Cisco Inline Power	ILP	7.5W		2 wire pairs
IEEE 802.3af	Type 1 PoE	15W	44-57v	2 wire pairs ≥ CAT3
IEEE 802.3at	Type 2 PoE+	30W	50-57v	2 wire pairs ≥ CAT5
IEEE 802.3bt	Type 3 UPoE	60W	50-57v	4 wire pairs ≥ CAT5
	Type 4 UPoE+	100W	52-57v	

IEEE *Active PoE* negotiates power delivery via LLDP. Nonstandard *Passive PoE* provides a constant voltage that may **damage** equipment. **Mode A** PoE energizes the 2 data wire pairs; **Mode B** PoE energizes the 2 spare wire pairs; **4Pair** PoE energizes all 4 wire pairs.

2 Layer 2 Protocols

Table 2.1: EtherType Values

`0x0800`	IPv4 Packet
`0x0806`	ARP
`0x2000`	Cisco CDP
`0x8100`	IEEE 802.1Q
`0x86dd`	IPv6 Packet
`0x8809`	Ethernet Slow Protocols
`0x8847`	MPLS Unicast
`0x8848`	MPLS Multicast
`0x8863`	PPPoE Discovery
`0x8864`	PPPoE Session
`0x888e`	IEEE 802.1x EAPOL
`0x88cc`	IEEE 802.1AB LLDP

Table 2.2: Layer 2 Multicast

`0000.0c07.acXX`	Cisco HSRPv1
`0000.0c9f.fXXX`	Cisco HSRPv2
`0000.5e00.01XX`	IETF VRRP
`0007.b40X.XXYY`	Cisco GLBP
`0100.5eXX.XXXX`	IPv4 Multicast
`3333.XXXX.XXXX`	IPv6 Multicast
`0100.0ccc.cccc`	Cisco CDP / VTP / UDLD
`0180.c200.000e`	IEEE 802.1AB LLDP
`0100.0ccc.cccd`	Cisco PVST+ / PVRST
`0180.c200.0000`	IEEE 802.1D STP
	IEEE 802.1w RSTP

Note: `0180.c200.000X` multicast addresses are not forwarded by 802.1D-compliant bridges. Not all Layer 2 protocols support multicast.

2.1 Ethernet II / IEEE 802.3

Preamble	7 Bytes	10101010
SFD	1 Byte	10101011
Destination MAC	6 Bytes	
Source MAC	6 Bytes	
Type (Ethernet II)	2 Bytes	EtherType (Table 2.1)
Length (802.3)		Payload Length in Bytes
Data	varies	46-1500 Bytes based on MTU
FCS	4 Bytes	

Table 2.3: IEEE 802.2 Logical Link Control (LLC)

Destination Service Access Point (DSAP)	1 Byte
Source Service Access Point (SSAP)	1 Byte
Control	1-2 Bytes

Table 2.4: IEEE SubNetwork Access Protocol (SNAP) Header

Organizationally Unique ID (OUI)	3 Bytes	`0x000000` or Vendor OUI
Type	2 Bytes	EtherType (Table 2.1)

Note: Each 802.3 frame includes an 802.2 LLC header for process multiplexing. Per RFC 1042, an 802.2 LLC header with value `0xaaaa03` includes a SNAP header identifying the EtherType.

2.2 VLAN Tagging

Table 2.5: IEEE 802.1Q Tagging

Tag Protocol Identifier (TPID)	16 bits	EtherType (`0x8100`, Table 2.1)
TCI: Priority Code Point (PCP)	3 bits	QoS Class-of-Service (CoS) Marking (Section 6)
TCI: Drop Eligible Indicator (DEI)	1 bit	QoS Drop Eligibility
VLAN ID	12 bits	

Table 2.6: Cisco InterSwitch Link (ISL)

Destination Address	40 bits	Multicast (`0100.0c00.00` / `0300.0c00.00`)
Type	4 bits	Frame Type
User	4 bits	Priority Handling
Source Address	48 bits	Sending Switchport MAC
LEN	16 bits	Original Frame Length in Bytes
AAAA03	24 bits	SNAP/LLC Field (`0xaaaa03`)
HSA	24 bits	Source Address OUI (`0000.0c`)
VLAN	15 bits	VLAN ID
BPDU Flag	1 bit	Flag BPDU / CDP / VTP frames
INDEX	16 bits	Diagnostics
RES	16 bits	Token Ring / FDDI Frames
Data	varies	8-196000 bit Unmodified original frame
FCS	32 bits	

Note: Industry-standard IEEE 802.1Q supports both *normal-range* VLANs (1-1005) and *extended-range* VLANs (1006-4094); Cisco ISL is deprecated.

2.3 Cisco VLAN Trunking Protocol (VTP)

Cisco VTP dynamically advertises a *VLAN Database* to participating switches over Cisco ISL and IEEE 802.1Q trunk links. Participating switches use either *VTP Server Mode* or *VTP Client Mode*, and default to VTP Server Mode with a `Config Revision Number` of 0. Each time a VTP Server's VLAN Database is locally updated, the `Config Revision Number` increments and *VTP Synchronization* occurs.

VTP Synchronization uses a *VTP Summary Advertisement* (Table 2.7) alongside 1 or more *VTP Subset Advertisements* (Table 2.8) to advertise the revised VLAN Database. VTP Servers also send out a Summary Advertisement (alongside 0 or more Subset Advertisements) every 5 minutes. To participate, newly-connected switches may send a *VTP Advertisement Request* (Table 2.10) over each trunk link that comes up. A switch only listens to VTP messages in its `VTP Management Domain` (default NONE). An MD5-hashed `VTP Password` (default NONE) can be configured to prevent unauthorized switches from participating in the VTP Management Domain.

VTP Clients participate in VTP Synchronization but disallow local VLAN configurations. *VTP Transparent Mode* or *VTP Off Mode* switches use a local VLAN configuration instead of the VLAN Database, although they may forward VTP messages.

Table 2.7: VTP Summary Advertisement

Version	1 Byte	VTP Version (1-3)
Code	1 Byte	Summary Advertisement (`0x01`)
Followers	1 Byte	Indicates a Subset Advertisement
MgmtD Len	1 Byte	
Management Domain	32 Bytes	VTP Domain Name
Config Revision Number	4 Bytes	
Updater Identity	4 Bytes	Originating VTP Server (IP Address)
Update Timestamp	12 Bytes	Datetime of revision
MD5 Digest	16 Bytes	VTP Password hash (if configured)

Table 2.8: VTP Subset Advertisement

Version	1 Byte	VTP Version (1-3)
Code	1 Byte	Subset Advertisement (`0x02`)
Sequence Number	1 Byte	Sequence in packet stream following Summary Advertisement
MgmtD Len	1 Byte	
Management Domain	32 Bytes	VTP Domain Name
Config Revision Number	4 Bytes	
VLAN-Info Field(s)	4 Bytes	Advertised VLAN(s) (Table 2.9)

Table 2.9: The VLAN-Info Field

V-Info-Len	1 Byte
Status	1 Byte
VLAN-Type	1 Byte
VLAN-Name Len	1 Byte
ISL VLAN-ID	2 Bytes
MTU Size	2 Bytes
802.10 Index	4 Bytes
VLAN-Name	4 Bytes

Table 2.10: Advertisement Requests

Version	1 Byte	VTP Version (1-3)
Code	1 Byte	Advertisement Request (`0x03`)
Reserved	1 Byte	
MgmtD Len	1 Byte	
Management Domain	32 Bytes	VTP Domain Name
Start-Value	32 Bytes	Identifies the requested Subset Advertisement

2.4 Cisco Discovery Protocol (CDP) / IEEE 802.1AB Link-Layer Discovery Protocol (LLDP)

Table 2.11: CDP Frame Format

Version	1 Byte	CDP Version (1-2)
Time-to-Live (TTL)	1 Byte	CDP `Hold` timer
Checksum	2 Bytes	
TLV List	varies	CDP TLV(s)

Table 2.12: CDP TLVs

Type	2 Bytes
Length	2 Bytes
Value	varies

CDPv2 advertises Cisco device information to directly-connected neighbors. Each device maintains a *CDP Neighbor Table* based on received CDP messages. It is necessary for Cisco IP Telephony and some other features.

Table 2.13: IEEE 802.1AB LLDP PDU Format

Chassis ID TLV	9 Bytes	Source MAC (Type 1)
Port ID TLV	6 Bytes	Source Interface (Type 2)
Time-to-Live TLV	4 Bytes	LLDP `Hold` timer (Type 3)
Optional TLVs	varies	Optional LLDP TLV(s) (Types 4-127)
End TLV	2 Bytes	End of LLDP PDU (Type 0)

Table 2.14: LLDP TLVs

Type	7 bits
Length	9 bits
Value	0-511 Bytes

LLDP advertises vendor-neutral device information to directly-connected neighbors. Each device maintains a *LLDP Neighbor Table* based on received LLDP messages. LLDP devices can autonegotiate the use of ANSI/TIA-1057 *LLDP Media Endpoint Discovery* (LLDP-MED), providing advanced autodiscovery, VoIP, PoE, and other features.

2.5 IEEE 802.1D Spanning-Tree Protocol (STP) / IEEE 802.1w Rapid STP (RSTP)

Protocol Identifier	2 Bytes	0 for STP / PVST+
Version	1 Byte	0 for STP / PVST+ 2 for RSTP / PVRST
Message Type	1 Byte	Identify Configuration / TCN BPDUs (`0x02` for RSTP/MSTP)
Flags	1 Byte	Signals TC / TCA bits
Root ID	8 Bytes	The sender's Root BID (Table 2.15)
Root Path Cost	4 Bytes	The sender's cost to Root
Bridge ID	8 Bytes	The sender's BID (Table 2.15)
Port ID	2 Bytes	The sender's `Port Prio.Nbr`
Message Age	2 Bytes	Time since Root sent this BPDU
Max Age	2 Bytes	Time until BPDU expires
Hello Time	2 Bytes	How often Root sends BPDUs
Forward Delay	2 Bytes	Time spent in each transition state

Table 2.15: Spanning Tree Bridge ID (BID) Format

Base Priority	4 bits	Configured bridge priority (multiple of 4096)
System ID Extension	12 bits	The VLAN ID of this STP instance
System ID	48 bits	The bridge *Burned-In Address* (BIA)

Table 2.16: Spanning Tree Port Costs

Port Speed	STP IEEE Cost	Revised IEEE Cost	RSTP IEEE Cost
10 Mbps	100	100	2,000,000
100 Mbps	10	19	200,000
1 Gbps	1	4	20,000
10 Gbps	1	2	2,000
100 Gbps	-	1	200
1 Tbps	-	-	20
10 Tbps	-	-	2

Table 2.17: Spanning Tree Port States

STP State	RSTP State	Send/Receive BPDUs	Forward Data	Learn MACs
Disabled	Discarding	**No**	**No**	**No**
Blocking	Discarding	**Receive**	**No**	**No**
Listening	—	**Yes**	**No**	**No**
Learning	Learning	**Yes**	**No**	**Yes**
Forwarding	Forwarding	**Yes**	**Yes**	**Yes**

The *STP Convergence* Process:

1. **Elect Root Bridge:**
   (a) Lowest received BPDU `Root ID: Base Priority`
   (b) Tiebreaker: lowest received BPDU `Root ID: System ID`
2. **Elect *Root Ports* (RPs):**
   (a) Lowest received BPDU `Root Path Cost` + local Port Cost (Table 2.16)
   (b) Tiebreaker: lowest received BPDU `BID`
   (c) Tiebreaker: lowest received BPDU `Port ID: Prio.Nbr`
   (d) Other RSTP link-type point-to-point ports become *Alternate Ports* (APs)
3. **Elect *Designated Ports* (DPs):**
   (a) Lowest advertised BPDU `Root Path Cost`
   (b) Tiebreaker: lowest advertised BPDU `BID`
   (c) Tiebreaker: lowest advertised BPDU `Port ID: Prio.Nbr`
   (d) Other RSTP link-type shared ports on the same bridge become *Backup Ports* (BPs)
4. **Other Ports:**
   (a) Working ports become STP *Nondesignated Ports* (NDs)
   (b) Nonworking and disabled ports become STP disabled ports

Optional STP Features:

PortFast: Locally or globally configured ports immediately enter Forwarding state on edge ports. BPDUs are sent, but received BPDUs disable the feature.

BPDU Guard: Locally or globally configured (PortFast) ports prevent unauthorized devices from altering the STP topology. BPDUs are sent, but received BPDUs err-disable the port. Compatible with globally-configured BPDU Filter.

BPDU Filter: Locally configured ports ignore STP; globally configured (PortFast) ports do not send BPDUs. Compatible with BPDU Guard.

Root Guard: Locally configured ports protect the STP Root Bridge. BPDUs are sent, but received superior BPDUs err-disable the port (Root Inconsistent state). Incompatible with Loop Guard.

Loop Guard: Locally or globally configured (point-to-point ports) protect against unidirectional links, preventing RPs and NDs from becoming DPs. Ports whose `Max Age` reaches 0 err-disable (Loop Inconsistent state). Incompatible with Root Guard.

2.6 RFC 826 Address Resolution Protocol (ARP)

HTYPE	16 bits	L2 Protocol (1 for Ethernet)
PTYPE	16 bits	L3 Protocol (EtherType, Table 2.1)
HLEN	8 bits	L2 Address Length in Bytes
PLEN	8 bits	L3 Address Length in Bytes
Operation	16 bits	Message Type (1 for Request, 2 for Reply)
Origin HW	48 bits	Source MAC
Origin IP	32 bits	Source IP
Target HW	48 bits	Destination MAC
Target IP	32 bits	Destination IP

Note: As a Layer 2 protocol, all ARP messages are encapsulated directly within an Ethernet frame.

Dynamic ARP Inspection (DAI) is an optional switch security feature to prevent ARP Poisoning and ARP DoS. The *DHCP Snooping Binding Table* is used to filter incoming ARP messages based on their `Origin HW` and `Origin IP` values; an ARP ACL can also be configured for hosts using static IP addresses. Optional verification checks compare the ARP `Origin/Target HW` values against the frame `Source/Destination MAC` and ensure the ARP `Origin/Target IP` fields contain unicast values. This behavior is disabled on DAI *trusted ports*. DAI uses optional per-interface rate limits to prevent DoS attacks against the switch CPU and ARP table.

2.7 IEEE 802.11 Wireless LANs (WLANs)

Frame Control	2 Bytes	Message Type / Subtype
Duration / ID	2 Bytes	Frame Transmission Time / Client Association
Address 1	6 Bytes	Dst / Src / Rx / Tx Address
Address 2	6 Bytes	Dst / Src / Rx / Tx Address
Address 3	6 Bytes	Dst / Src / Rx / Tx Address
Sequence Control	2 Bytes	Fragmentation / Duplication Management
Address 4	6 Bytes	Dst / Src / Rx / Tx Address
QoS Control	2 Bytes	Section 6
HT Control	4 Bytes	HT Operations (802.11n and later)
Data	varies	
FCS	4 Bytes	

In America, the 2.4-GHz ISM band has 11 overlapping channels (1/6/11 nonoverlapping) and the 5-GHz U-NII band has 23 nonoverlapping channels. WLANs operate at half duplex with *Carrier Sense Multiple Access / Collision Avoidance* (CSMA/CA) to minimize collisions.

The original IEEE 802.11-1997 standard uses *Frequency Hopping Spread Spectrum* (FHSS) encoding in the 2.4-GHz band without channels; each consecutive transmission uses a slightly different frequency to minimize collision risk. Modern IEEE 802.11 standards use either *Direct Sequence Spread Spectrum* (DSSS) or *Orthogonal Frequency Division Multiplexing* (OFDM) encoding. DSSS uses the 2.4-GHz band with a 22 MHz channel width; OFDM uses either band with a 20 MHz channel width.

WLANs use a *Wi-Fi Protected Access* (WPA) standard to ensure message privacy and integrity for wireless-frames in-transit. Devices authenticate with the AP during the association process. Clients authenticate using either a *Pre-Shared Key* (PSK) or IEEE 802.1x Access Control with an IEEE 802.11i *Extensible Authentication Protocol* (EAP) framework. See Table 8.7 for details.

Table 2.18: IEEE 802.11 Standards

Standard	RF Band	Bandwidth	Encoding	Name
-1997	2.4 GHz	2 Mbps	FHSS/DSSS	
b	2.4 GHz	11 Mbps	DSSS	
a	5 GHz	54 Mbps	OFDM	
g	2.4 GHz	54 Mbps	OFDM	
n	2.4 / 5 GHz	600 Mbps	OFDM	Wi-Fi 4 (HT)
ac	5 GHz	6.93 Gbps	OFDM	Wi-Fi 5 (VHT)
ax	2.4 / 5 GHz 6 GHz	9.6 Gbps	OFDM	Wi-Fi 6 (HE) Wi-Fi 6e
be	2.4/5/6 GHz	46 Gbps	OFDM	Wi-Fi 7 (EHT)

Table 2.19: WLC Deployment

Deployment	WLC Location	Clients	APs
Unified	Central	64,000	6,000
Cloud	Data Center	32,000	3,000
Embedded	Access Switch	4,000	200
Mobility Express	LAP	2,000	100

Table 2.20: WLC Ports and Interfaces

WLC Port	WLC Interface	VLAN	Usage
Console			Initial config
Service Port	Service Port	OOB-MGMT	Out-of-band management (access port) *bootup / system recovery*
Redundancy	Redundancy Management	MGMT	In-band management (standby WLC) *HA redundancy*
DS	Management	MGMT	In-band management (active WLC) *Form CAPWAP tunnels*
DS	Virtual	Mobility Group	DHCP Relay, WebAuth
DS	Dynamic	USERS	Bind WLANs to VLANs (tunnel LAG)

Note: Lightweight APs require a *Wireless LAN Controller* (WLC) and CAPWAP to support WLANs. Each Autonomous AP can independently support multiple WLANs.

Autonomous AP Modes:

Infrastructure: Offer BSS' on an RF Channel

Repeater: Extend a BSA via retransmission

WorkGroup Bridge (WGB): Bridge wired device(s) to a WLAN

Bridge: Form a Point-to-Point (P2P) / Point-to-Multipoint (P2MP) link between LANs

Mesh: Bridge traffic across APs in a large service area

Lightweight AP (LAP) Modes:

Local: Offer BSS' on an RF Channel

Monitor: Monitor for IDS events / rogue APs, determine STA positions

FlexConnect: Locally switch traffic if CAPWAP fails

Rogue Detector: Detect rogue devices (correlate wired and wireless MACs)

Sniffer: Capture WLAN traffic for analysis
Bridge: Form a Point-to-Point (P2P) / Point-to-Multipoint (P2MP) link or a mesh
Flex+Bridge: FlexConnect on a mesh LAP
SE-Connect: Detect interference sources (RF spectrum analysis)

2.8 ITU High-Level Data-Link Control (HDLC)

Flag	1 Byte	Synchronization
Address	1 Byte	Destination Node
Control	1 Byte	
Data	varies	
FCS	4 Bytes	

2.9 IETF RFC 1661 Point-to-Point Protocol (PPP) / Cisco HDLC (cHDLC)

Flag	1 Byte	Synchronization
Address	1 Byte	Destination Node
Control	1 Byte	
Type	2 Bytes	EtherType (Table 2.1)
Data	varies	
FCS	4 Bytes	

3 Layer 3 Protocols

Table 3.1: IPv4 Protocol / IPv6 Next Header Values

0x01	1	ICMP
0x02	2	IGMP
0x04	4	IPv4
0x06	6	TCP
0x11	17	UDP
0x29	41	IPv6
0x2f	47	GRE
0x3a	58	ICMPv6
0x58	88	EIGRP
0x59	89	OSPF
0x67	103	PIM
0x70	112	VRRP
0x89	137	MPLS-in-IP

Table 3.2: Layer 3 Multicast

224.0.0.1 ff02::1	All-IPv4-Nodes All-IPv6-Nodes	
224.0.0.2 ff02::2	All-IPv4-Routers All-IPv6-Routers	Cisco HSRPv1
224.0.0.5 ff02::5	All-SPF-Routers	OSPFv2 OSPFv3
224.0.0.6 ff02::6	All-SPF-DRs	OSPFv2 OSPFv3
224.0.0.9 ff02::9	All-RIP-Routers	RIPv2 RIPng
224.0.0.10 ff02::a	All-EIGRP-Routers All-EIGRPv6-Routers	EIGRP EIGRPv6
224.0.0.18	IETF VRRP	
224.0.0.102	Cisco HSRPv2 / GLBP	

Note: Each Layer 3 multicast address maps to a corresponding Layer 2 multicast address which may be used in the L2PDU.

The routing table is populated based on each route's *Administrative Distance* (AD). Route metric is calculated by the routing protocol and acts as a tiebreaker for multiple routes to the same destination via the same routing protocol. Some routing protocols are capable of multi-path load-balancing, resulting in multiple valid routes to the same destination under specific conditions.

Table 3.3: Route Types

Route Type	AD Value	IGP Type
Connected	0	
Static	1	
BGP	20	EGP
EIGRP	90	Advanced Distance Vector
IGRP	100	Distance Vector
OSPF	110	Link-State
IS-IS	115	Link-State
RIP	120	Distance Vector
EIGRP External	170	Advanced Distance Vector
iBGP	200	EGP
DHCP	254	
Invalid	255	

3.1 RFC 791 IP Version 4

Version	4 bits	IP Version (4)
IP Header Length (IHL)	4 bits	Header Length (Bytes ÷ 5)
DS Field	8 bits	QoS Type-of-Service (ToS) Marking (Section 6)
Packet Length	16 bits	Total Packet Length
Identification	16 bits	Fragmentation
Flags	3 bits	Fragmentation
Fragment Offset	13 bits	Fragmentation
Time-to-Live (TTL)	8 bits	Loop Prevention
Protocol	8 bits	Protocol Type (Table 3.1)
Header Checksum	16 bits	
Source IP	32 bits	
Destination IP	32 bits	
Options	varies	Optional Header Fields
Data	varies	

Table 3.4: RFC 791 / RFC 1918 Addressing

RFC 791	First Octet	Address Block	RFC 1918 Block
Class A	`0XXX XXXX`	0.0.0.0 - 127.0.0.0 /8	10.0.0.0 /8
Class B	`10XX XXXX`	128.0.0.0 - 191.255.0.0 /16	172.16.0.0 /12
Class C	`110X XXXX`	192.0.0.0 - 223.255.255.0 /24	192.168.0.0 /16
Class D	`1110 XXXX`	224.0.0.0 - 239.255.255.255	
Class E	`1111 XXXX`	240.0.0.0 - 255.255.255.255	

Table 3.5: IPv4 Subnetting Magic Numbers

Bit Position	1	2	3	4	5	6	7	8
Octet Mask	128	192	224	240	248	252	254	255
Addresses	128	64	32	16	8	4	2	1
Octet Wildcard	127	63	31	15	7	3	1	0

IPv4 hosts use an *ARP Table* (mapping Layer 2/3 addresses) and Layer 3 forwarding logic to send packets. Local traffic is forwarded directly; external traffic is forwarded to the default gateway address.

3.2 RFC 2460 IP Version 6

Version	4 bits	IP Version (6)
Traffic Class	8 bits	QoS Marking (Section 6)
Flow Label	20 bits	Experimental
Payload Length	16 bits	Data + Extension Headers Length
Next Header	8 bits	Protocol Type (Table 3.1)
Hop Limit	8 bits	Loop Prevention
Source Address	128 bits	
Destination Address	128 bits	
Data	varies	

Note: IPv6 uses a fixed 40-Byte header; IPv6 Options headers are sent separately.

Table 3.6: RFC 2460 Addressing

Address Class	Block	Address Format			
Global Unicast	Any		Prefix P bits	Subnet ID $64-P$ bits	+ Interface ID 64 bits
Unique Local Unicast	`fd00::/8`	`fd` 8 bits	+ Global ID 40 bits	+ Subnet ID 16 bits	+ Interface ID 64 bits
Link-Local Unicast	`fe80::/64`			`fe80:0:0:0` 64 bits	+ Interface ID 64 bits
Multicast	`ff00::/12`	`ff02::1:ffXX:XXXX/104` Solicited-Node Multicast			
	`ff01::/16`	Interface/Node-Local			
	`ff02::/16`	Link-Local			
	`ff05::/16`	Site-Local			
	`ff08::/16`	Org-Local			
	`ff0e::/16`	Global			

Note: IPv6 does not support broadcasts, only scoped multicasts.

Modified EUI-64 Process for Unique Address Generation:

1. Split the interface MAC address into two 24-bit parts.
2. Insert `0xfffe` between the two parts, creating a 64-bit Interface ID.
3. Invert the 7th bit (the *Universal/Local bit*) of the resulting Interface ID.

3.3 RFC 792 Internet Control Message Protocol (ICMP) / RFC 4443 ICMPv6

Type	8 bits	Message Type (Tables 3.7 and 3.8)
Code	8 bits	Message Subtype / Status Code (Tables 3.7 and 3.8)
Checksum	16 bits	
Header Data	32 bits	Message-specific fields
Payload	varies	

Table 3.7: ICMP Type.Code Values

0.0	Echo Reply
3.X	Destination Unreachable
8.0	Echo Request
9.0	Router Advertisement
10.0	Router Solicitation
11.X	Time Exceeded

Table 3.8: ICMPv6 Type.Code Values

1.X	Destination Unreachable
2.0	Packet Too Big
3.X	Time Exceeded
128.0	Echo Request
129.0	Echo Reply
133.0	NDP RS
134.0	NDP RA
135.0	NDP NS
136.0	NDP NA
137.0	NDP Redirect

3.4 RFC 4861 ICMPv6 Neighbor Discovery Protocol (NDP)

ICMPv6 NDP offers core functionality for IPv6 networks, including *Neighbor Discovery*, *Router Discovery*, *Stateless Address Autoconfiguration* (SLAAC), and *Duplicate Address Detection* (DAD).

Router Solicitation (RS) and *Router Advertisement* (RA) messages (Tables 3.9 and 3.11) replace DHCP/DHCPv6 default gateway discovery. RS messages are sent to All-IPv6-Routers multicast; RA messages are sent either to a unicast target address or to All-IPv6-Hosts multicast.

Neighbor Solicitation (NS) and *Neighbor Advertisement* (NA) messages (Tables 3.10 and 3.12) replace ARP. NS messages are sent to a solicited-node multicast target address; NA messages are sent either to a unicast target address or to All-IPv6-Hosts multicast.

The SLAAC Process:

1. The IPv6 host learns the IPv6 prefix used on the link, from any router, using NDP RS/RA messages.
2. The IPv6 host builds an IPv6 unicast address using the learned prefix and a random/EUI-64 generated interface ID.
3. Before using the address, the IPv6 host uses DAD to ensure that no other IPv6 host is already using the same address.

The DAD Process:

1. The IPv6 host sends an NDP NS message, listing its own IPv6 unicast address as the `Target Address`.
2. If no other IPv6 host uses that address, then no host should reply with an NDP NA message; the host is safe to use that address on the IPv6 network.
3. If another IPv6 host uses that address, they reply with an NA message. The local host receives an NDP NA message and avoids using that address until the issue is resolved.

Table 3.9: NDP RS

Type	8 bits	Message Type (133)
Code	8 bits	Message Subtype (0)
Checksum	16 bits	
Reserved	32 bits	Unused (0)
Options	varies	

Table 3.10: NDP NS

Type	8 bits	Message Type (135)
Code	8 bits	Message Subtype (0)
Checksum	16 bits	
Reserved	32 bits	Unused (0)
Target Address	128 bits	
Options	varies	

Table 3.11: NDP RA

Type	8 bits	Message Type (134)
Code	8 bits	Message Subtype (0)
Checksum	16 bits	
Current Hop Limit	8 bits	Default IPv6 Hop Count Value
Managed Address Flag	1 bit	Indicates DHCPv6 Address Services
Other Config Flag	1 bit	Indicates DHCPv6 Other Services
Reserved	6 bits	Unused (0)
Router Lifetime	16 bits	Default Router Lifetime
Reachable Time	32 bits	Neighbor Unreachability Detection
Retransmit Time	32 bits	Time between NS message retransmissions (ms)
Options	varies	

Table 3.12: NDP NA

Type	8 bits	Message Type (136)
Code	8 bits	Message Subtype (0)
Checksum	16 bits	
From Router Flag	1 bit	Identifies sender as router
Solicited Flag	1 bit	Indicates solicitation by NDP NS
Override Flag	1 bit	Overrides existing cache entry
Reserved	29 bits	Unused (0)
Target Address	128 bits	
Options	varies	

Note: Unlike IPv4 ARP, ICMPv6 NDP messages are encapsulated within an IPv6 packet.

IPv6 hosts use an *NDP Neighbor Table* (mapping Layer 2/3 addresses) and an IPv6 routing table (populated by Router Discovery) to send packets. *On-link* traffic is forwarded directly; *off-link* traffic is forwarded to the default gateway's link-local address.

3.5 RFC 2328 Open Shortest Path First (OSPFv2)

OSPFv2 is a link-state IGP for dynamic routing which maintains a *Link-State Database* (LSDB) representing the internetwork of connected OSPF routers within an *OSPF area*. Each OSPF router forms OSPF neighborships with connected OSPF routers through a series of OSPF messages and *OSPF neighbor states*, which synchronize their LSDBs. Each OSPF area must connect to *backbone area* 0 via an OSPF *Area Border Router* (ABR). An OSPF *Autonomous System Border Router* (ASBR) connects the local *Autonomous System* (AS) with one or more external AS.

Table 3.13: OSPF LSA Types

LSA Type	Source	Conditions / Notes
Type 1 Router	SPF-Routers	1 per intra-area router
Type 2 Network	SPF-DRs	1 per DR/BDR subnet
Type 3 Summary	ABRs	1 per inter-area subnet
Type 3 Default	ABRs	Advertises the local ABR
Type 4 Summary ASBR	ABRs	Advertises a non-local ASBR
Type 5 AS-External	ASBRs	1 per AS-External network
Type 7 NSSA	ASBRs	1 per AS-External network (stub area)

A *Stub Area* is a non-backbone OSPF area with a Type 3 Default and Type 3 Summary LSAs. A *Not-So-Stubby Area* is a stub area with Type 7 LSAs. A *Totally Stubby Area* is a stub area with no Type 3 Summary LSAs. A *Totally NSSA* is a totally stubby area with Type 7 LSAs.

Table 3.14: OSPF Link-State Advertisement (LSA) Header

LS Age	2 Bytes	Seconds since LSA originated
Options	1 Byte	
LS Type	1 Byte	LSA Type (Table 3.13)
Link-State ID	4 Bytes	Determined by `LS Type`
Advertising Router	4 Bytes	Advertising Router `RID`
LS Sequence Number	4 Bytes	Used by routers to judge LSAs
LS Checksum	2 Bytes	Checksum of LSA (excluding `LS Age`)
Length	2 Bytes	LSA + Header Length in Bytes

Each LSDB is a collection of *OSPF Link-State Advertisements* (LSAs) whose contents describe the internetwork according to their LSA type (Table 3.13). Note that the number of OSPF routers, OSPF areas, and other variables determine the number and type of LSAs within the LSDB.

Table 3.15: OSPF Hello

Version	1 Byte	OSPF Version (2)
Type	1 Byte	OSPF Packet Type (1)
Packet Length	2 Bytes	Header + Packet Length in Bytes
Router ID	4 Bytes	Advertising Router `RID`
Area ID	4 Bytes	Advertising Router's Area ID
Checksum	2 Bytes	
AuType	2 Bytes	OSPF Authentication Type (0-2)
Authentication	8 Bytes	Determined by `AuType`
Network Mask	4 Bytes	Sending interface's netmask
Hello Interval	2 Bytes	OSPF `Hello` Interval
Options	1 Byte	
Rtr Pri	1 Byte	Interface OSPF Priority
Router Dead Interval	4 Bytes	OSPF `Dead` Interval
Designated Router	4 Bytes	OSPF DR IP Address
Backup Designated Router	4 Bytes	OSPF BDR IP Address
Neighbor	varies	Known Neighbor `RID`(s)

OSPF Hello packets are used for neighbor discovery and maintenance. OSPF routers use it to learn each other's `RID` in neighbor state **INIT** and determine whether they are OSPF-compatible.

OSPF routers are compatible if their `RID`s are unique and if their `Version`, `Area ID`, `Network Mask`, `Hello Interval`, and `Router Dead Interval` match. If OSPF authentication is configured, the `AuType` and `Authentication` must also match. Two OSPF-compatible routers enter neighbor state **2WAY**, are considered OSPF neighbors, and are ready to begin the 2-way LSDB exchange process.

OSPF elections may take place among OSPF routers connected to the same subnet. The router with the highest `Rtr Pri` is elected *Designated Router* (DR), with the highest `RID` serving as tiebreaker; the runner-up becomes the *Backup Designated Router* (BDR). There is no preemption and the remaining routers become *DROthers*. The DR/BDR routers become fully-adjacent neighbors with all OSPF routers in the subnet; DROther routers remain in 2WAY state with each other.

Table 3.16: OSPF Database Description (DD)

Version	1 Byte	OSPF Version (2)
Type	1 Byte	OSPF Packet Type (2)
Packet Length	2 Bytes	Header + Packet Length in Bytes
Router ID	4 Bytes	Advertising Router `RID`
Area ID	4 Bytes	Advertising Router's Area ID
Checksum	2 Bytes	
AuType	2 Bytes	OSPF Authentication Type (0-2)
Authentication	8 Bytes	Determined by `AuType`
Interface MTU	2 Bytes	IP MTU in Bytes
Options	1 Byte	
Reserved	5 bits	0
Initial	1 bit	1 indicates first DD packet
More	1 bit	1 indicates more DD packets follow
Master/Slave	1 bit	1 indicates master, 0 indicates slave
DD Sequence Number	4 Bytes	sequence number of DD packets
LSA Headers	varies	LSA header(s) (Table 3.14)

OSPF DD packets are used by both routers to summarize and compare their local LSDBs. The *master router* (higher `RID`) enters neighbor state **EXSTART** by sending an OSPF DD packet, which initializes the LSDB exchange process. The *slave router* (lower `RID`) enters neighbor state **EXCHANGE** by responding with its own OSPF DD packet.

Table 3.17: OSPF Link-State Request (LSR)

Version	1 Byte	OSPF Version (2)
Type	1 Byte	OSPF Packet Type (3)
Packet Length	2 Bytes	Header + Packet Length in Bytes
Router ID	4 Bytes	Advertising Router `RID`
Area ID	4 Bytes	Advertising Router's Area ID
Checksum	2 Bytes	
AuType	2 Bytes	OSPF Authentication Type (0-2)
Authentication	8 Bytes	Determined by `AuType`
LS Type	4 Bytes	Requested LSA Type (Table 3.13)
Link-State ID	4 Bytes	Determined by `LS Type`
Advertising Router	4 Bytes	Sending Router's `RID`

Table 3.18: OSPF Link-State Update (LSU)

Version	1 Byte	OSPF Version (2)
Type	1 Byte	OSPF Packet Type (4)
Packet Length	2 Bytes	Header + Packet Length in Bytes
Router ID	4 Bytes	Advertising Router `RID`
Area ID	4 Bytes	Advertising Router's Area ID
Checksum	2 Bytes	
AuType	2 Bytes	OSPF Authentication Type (0-2)
Authentication	8 Bytes	Determined by `AuType`
Number of LSAs	4 Bytes	
LSAs	varies	LSA(s)

Table 3.19: OSPF Link-State Acknowledgment (LSAck)

Version	1 Byte	OSPF Version (2)
Type	1 Byte	OSPF Packet Type (5)
Packet Length	2 Bytes	Header + Packet Length in Bytes
Router ID	4 Bytes	Advertising Router `RID`
Area ID	4 Bytes	Advertising Router's Area ID
Checksum	2 Bytes	
AuType	2 Bytes	OSPF Authentication Type (0-2)
Authentication	8 Bytes	Determined by `AuType`
LSA Headers	varies	Acknowledged LSA header(s) (Table 3.14)

Both routers enter neighbor state **LOADING** after the LSDB exchange process has been initiated. The master router requests certain LSAs using OSPF LSR packets (Table 3.17). The slave router responds with OSPF LSU packets (Table 3.18) containing the requested LSAs, which the master router acknowledges using OSPF LSAck packets (Table 3.19). This process then reverses, with the slave router requesting LSAs that the master router supplies. Routers which complete the LSDB exchange process enter neighbor state **FULL** and are *fully-adjacent OSPF neighbors*.

OSPF runs *Dijkstra's Shortest-Path First* (SPF) algorithm on the LSDB to calculate the best routes to each network. This calculation depends on the LSDB size and is performed independently for each OSPF area. Each OSPF interface calculates an *OSPF Cost* (*OSPF Reference Bandwidth* ÷ *Interface Bandwidth*) which affects the resulting OSPF route metric.

4 Layer 4 Protocols

Table 4.1: Well-Known Ports

TCP 20	FTP Data
TCP 21	FTP Control
TCP 22	SSH / SFTP
TCP 23	Telnet
TCP 25	SMTP
TCP 49	Cisco TACACS+
53	DNS
UDP 67	DHCP Server
UDP 68	DHCP Client
UDP 69	TFTP
TCP 80	HTTP
TCP 110	POP3
UDP 123	NTP
UDP 161	SNMP Agent
UDP 162	SNMP Manager
TCP 443	HTTPS
UDP 514	Syslog
TCP 989	FTPS Data
TCP 990	FTPS Control

Table 4.2: Registered Ports

UDP 1812	RADIUS Auth
UDP 1813	RADIUS Accounting
TCP 1985	Cisco HSRP
UDP 5246	CAPWAP Control
UDP 5247	CAPWAP Data

Note: *Well-Known Ports* range from 0-1023, *Registered Ports* range from 1024-49151, and *Ephemeral Ports* range from 49152-65535.

4.1 RFC 768 User Datagram Protocol (UDP)

Source Port	2 Bytes	Tables 4.1 and 4.2
Destination Port	2 Bytes	Tables 4.1 and 4.2
Length	2 Bytes	Header + Data Length in Bytes
Checksum	2 Bytes	
Data	varies	

UDP is a *connectionless* protocol offering port-based multiplexing without any delivery guarantee. This is optimal for latency-sensitive applications which are fault-tolerant or implement their own error recovery mechanisms, such as VoIP, DNS, DHCP, TFTP, SNMP, Syslog, QUIC, and others.

4.2 RFC 793 Transmission Control Protocol (TCP)

Source Port	2 Bytes	Tables 4.1 and 4.2
Destination Port	2 Bytes	Tables 4.1 and 4.2
SEQ Number	4 Bytes	Windowing / Flow Control (SEQ flag)
ACK Number	4 Bytes	Windowing / Flow Control (ACK flag)
Data Offset	4 bits	
Reserved	6 bits	Future Use (0)
Flags	6 bits	Connection Management
Window	2 Bytes	Connection Window Size
Checksum	2 Bytes	
Urgent	2 Bytes	Last urgent data byte (URG flag)
Data	varies	

TCP is a *connection-oriented* protocol offering **error recovery**, **flow control**, **connection establishment/termination**, and **ordered data transfer / segmentation** features at the cost of additional overhead.

The TCP *3-way handshake* (`SYN SYN-ACK ACK`) sets up the connection `SEQ Number` and `ACK Number` for ordered data transfer. The `Window` determines how much data can be sent before requiring an acknowledgement. It increases when no errors occur and decreases for each missed acknowledgement, providing flow control and error recovery. Data is assumed lost/errored if not acknowledged within a certain time interval. The TCP *4-way termination* process (`FIN-ACK ACK FIN-ACK ACK`) closes the connection after data transfer is complete.

5 Layer 5 Applications

5.1 RFC 959 File Transfer Protocol (FTP)

FTP manages file transfers between FTP clients and FTP servers in clear-text over TCP. A persistent *FTP Control Connection* over port 21 defines the available FTP client functions for remotely managing/transferring files. An *FTP Data Connection* is established only when a file is transferred and often uses a nonstandard port. It is established by the server in *FTP Active Mode*, or by the client in *FTP Passive Mode*; passive mode is required when the client sits behind a firewall or NAT.

Note: The client issues the `FTP PORT` command for FTP Active mode and the `FTP PASV` command for FTP Passive mode. The client issues the `FTP AUTH` command for FTPS Explicit mode.

FTP Secure (FTPS) implements TLS to provide secure authentication and data encryption. FTPS clients using *FTPS Explicit Mode* must explicitly initialize a TLS tunnel after establishing each FTP connection. FTPS clients using *FTPS Implicit Mode* begin each FTP connection with a TLS

connection automatically.

SSH FTP (SFTP) encrypts file transfers over an SSH connection instead of using TLS. *Trivial FTP* (TFTP) uses UDP with built-in error detection and offers minimal functionality.

5.2 RFC 2131 Dynamic Host Configuration Protocol (DHCP)

Message Type	1 Byte	Message Type (request/reply)
HTYPE	1 Byte	L2 Protocol (1 for Ethernet)
HLEN	1 Byte	L2 Address Length in Bytes
Hops	1 Byte	Optionally boot via relay agent
Transaction ID	4 Bytes	Identifies client-server exchange (random)
Seconds	2 Bytes	Time since client began request
Broadcast Flag	1 bit	broadcast/unicast replies
Reserved	15 bits	Future Use (0)
Client IP	4 Bytes	Current Client IP
Your IP	4 Bytes	Your Client IP
Next Server IP	4 Bytes	Next server in bootstrap process
Relay Agent IP	4 Bytes	Boot via relay agent
CHADDR	16 Bytes	Client Hardware Address
Server Name	64 Bytes	Optional Server Hostname
File Name	128 Bytes	Optional Boot File
Magic Cookie	4 Bytes	Identifies DHCP over Bootp (`0x63.82.53.63`)
Options	varies	One or more option headers (Table 5.1)

Table 5.1: DHCP Options

Option	Value
1	Subnet Mask
3	Default Router
6	DNS Server
12	Client Hostname
28	Broadcast Address
43	WLC IP Address
50	Requested IP Address
51	Address Lease Time
53	DHCP Message Type
54	DHCP Server ID
55	Parameter Requests
58	Renewal Time Value
59	Rebinding Time Value
66	TFTP Server IP Address
82	Relay Agent Information
150	TFTP Server List
255	End

The DHCP Lease Process:

1. The DHCP client broadcasts a `DHCP Discover` message to any local DHCP servers.
2. The DHCP server replies with a `DHCP Offer` message containing configuration information.
3. The client broadcasts a `DHCP Request` message to accept or a `DHCP Decline` message deny an offer.
4. The server replies to a successful request with a `DHCP Acknowledge` message.
5. The client can send a `DHCP Release` message any time to release its current DHCP lease.

DHCP Relay can be configured on the default gateway LAN interface when the DHCP server exists in another subnet. This causes the default gateway to insert `DHCP Option 82` into received DHCP client messages and forward them to the DHCP server as unicast packets. *DHCP Snooping* automatically enables this feature as the *DHCP Snooping Information Option*.

DHCP Snooping is an optional switch security feature to prevent DHCP Poisoning and DHCP DoS. The *DHCP Snooping Binding Table* maps DHCP `CHADDR` values to their corresponding switchport, VLAN, frame `Source MAC`, and packet `Source IP` values based on observed DHCP flows. It ensures consistency between table entries and subsequent DHCP client messages; all DHCP server messages are filtered by default. This behavior is disabled on DHCP Snooping *trusted ports*. DHCP Snooping uses optional per-interface rate limits to prevent DoS attacks against the switch CPU and DHCP servers.

5.3 RFC 7230 HyperText Transfer Protocol (HTTP)

Note: See RFCs 9110/9111 plus the IANA Field Name Registry and IANA Message Headers for HTTP header fields and their names.

HTTP manages file transfers between web clients (browsers) and web servers over TCP. Client requests specify a *Uniform Resource Identifier* (URI, RFC 7595) adhering to the `SCHEME://AUTHORITY/PATH` format (typically `PROTOCOL://SERVER_NAME/OBJECT` for web pages). Requests also specify an *HTTP Verb*, typically corresponding to a *CRUD* action. Web servers respond to client requests with an *HTTP Return Code* and any relevant data.

Table 5.2: Common HTTP Verbs

HTTP Verb	CRUD Action	Description
`HTTP POST`	Create	Create/initialize new data structures/variables
`HTTP GET`	Read	Read variable names/structures/values
`HTTP PATCH/PUT`	Update	Update/replace some variable values
`HTTP DELETE`	Delete	Delete some data structures/variables

Table 5.3: HTTP Return Codes

Code	Type	Meaning
`1XX`	Informational	Request was received and is being processed
`2XX`	Successful	Request was received, understood, and accepted
`3XX`	Redirection	Further action required to complete request
`4XX`	Client Error	Request contains bad syntax or cannot be fulfilled
`5XX`	Server Error	Server failed to fulfill an (apparently) valid request

Modern web browsers support *HTTP Secure* (HTTPS) using TLS (RFC 5246) to dynamically secure a connection between the client and server. Initializing a TLS session creates a client VPN tunnel which authenticates the user and encrypts the data transfer between that client and server only.

5.4 RFC 5424 System Logging (Syslog)

Cisco IOS generates system event logs categorized based on *severity level* (Table 5.4). Log messages use the `TIMESTAMP SEQ_NUM %FACILITY-SEVERITY-MNEMONIC: DESCRIPTION` format and may be stored locally for review. Devices can be configured for centralized logging to a Syslog server over UDP based on severity level, freeing local device RAM for other tasks and simplifying event correlation among devices.

Table 5.4: Logging Keywords

Keyword	Severity	Description
Emergency	0	System Unusable
Alert	1	Immediate Action Required
Critical	2	Critical Conditions
Error	3	Error Conditions
Warning	4	Warning Conditions
Notification	5	Significant Conditions
Informational	6	Information
Debug	7	`debug` Messages

6 RFC 2475 Quality of Service (QoS)

PCP7	**CS7**			
Network Control	56 `0x38`			
PCP6	**CS6**			
Internetwork Control	48 `0x30`			
PCP5	**CS5**			**EF**
Voice	40 `0x28`			46 `0x2e`
PCP4	**CS4**	**AF41**	**AF42**	**AF43**
Video	32 `0x20`	34 `0x22`	36 `0x24`	38 `0x26`
PCP3	**CS3**	**AF31**	**AF32**	**AF33**
Critical Apps	24 `0x18`	26 `0x1a`	28 `0x1c`	30 `0x1e`
PCP2	**CS2**	**AF21**	**AF22**	**AF23**
Excellent Effort	16 `0x10`	18 `0x12`	20 `0x14`	22 `0x16`
PCP1	**CS1**	**AF11**	**AF12**	**AF13**
Background	8 `0x08`	10 `0x0a`	12 `0x0c`	14 `0x0e`
PCP0	**CS0**			
Best Effort	0 `0x00`			

Note: `CS` values use bit-pattern `XXX000`, resulting in an $8X$ DSCP value. `AF` values use bit-pattern `XXXYY0`, resulting in an $8X + 2Y$ DSCP value.

Table 6.1: QoS Fields

QoS Standard	Protocol Field(s)	Notes
IEEE 802.1p (CoS)	802.1Q `PCP/DEI`	Table 2.5
	802.11 `QoS Control`	Section 2.7
RFC 791 IPP (CS) RFC 2474/3168 (DSCP)	IPv4 `ToS Byte` (OLD) IPv4 `DS Field` (NEW)	Section 3.1
RFC 2460 (DSCP)	IPv6 `Traffic Class`	Section 3.2
RFC 3032/5462	MPLS `EXP`	Section 7

Quality of Service (QoS) is defined across several standards to provide preferential treatment for certain traffic. They define groups of QoS markings (shown above) as well as header fields used to mark QoS traffic. QoS-configured devices employ *Classification* to identify QoS traffic and apply specifically configured actions, including *Marking*, *Queuing*, *Policing*, *Shaping*, and/or *Congestion Avoidance* features. Marking is typically done by an initial device, simplifying Classification for downstream devices. QoS characterizes network traffic according to the following metrics:

Bandwidth: The speed of a link in *bits-per-second* (bps), or the capacity of the link to send a number of bits per-second.

One-Way Delay: The time between sending one packet and that same packet arriving at the destination host.

Round-Trip Delay: One-way delay plus the time for the receiver to send a packet back; the time to send one packet between two hosts and receive one back.

Jitter: The variation in one-way delay between any consecutive packets sent by the same application.

Loss: The number of lost messages expressed as a percentage of sent packets.

Certain types of traffic have strict requirements for these metrics, which must be met in order to ensure a good end-user experience. Technical limitations may also require much higher bandwidth per-flow for certain traffic (e.g. video).

Table 6.2: Traffic QoS Requirements

Traffic	One-Way Delay	Jitter	Loss
Voice Over IP (VoIP)	< 150 ms	< 30 ms	$< 1\%$
Video	200-400 ms	30-50 ms	0.1-1%

Note: A majority of loss occurs due to normal network operations, but may involve faulty hardware or network congestion.

7 RFC 3031 Multiprotocol Label Switching (MPLS)

Table 7.1: MPLS WAN Services

MPLS Service	Nodes	Notes
Layer 2 E-Line	2 per-EVC	P2P EVCs using 802.1Q `VLAN ID`s and subnets
Layer 2 E-LAN	n per-EVC	Mesh EVC using 1 subnet
Layer 2 E-Tree	n per-EVC	P2MP EVC using 1 subnet
Layer 2 MPLS VPN	n	CE-CE neighbors within 1 subnet
Layer 3 MPLS VPN	n	PE-CE neighbors with route redistribution

7.1 MPLS VPNs

A *Service Provider* (SP) connects customers to their *MPLS network* via *access links*. Each access link connects *Provider Edge* (PE) and *Customer Edge* (CE) routers. PE routers replace incoming frames' Data-Link headers, supporting many Internet access technologies (serial, MetroE, 4G/5G wireless, CATV/DSL, etc). They also insert/remove an MPLS header between Layers 2 and 3 for forwarding within the MPLS network. MPLS *label switching* logic isolates customer IP routes and packets from other customers, creating an unencrypted private *MPLS VPN* without fear of eavesdropping.

Layer 2 MPLS VPNs are transparent to the customer; all CE routers belong to the same subnet and become routing peers. Layer 2 MPLS VPNs include *Ethernet over MPLS* (EoMPLS, RFC 4448), *Virtual Private Wire Service* (VPWS, RFC 6624), and *Virtual Private LAN service* (VPLS, RFCs 4761/4762).

Layer 3 MPLS VPNs (RFCs 4364/4577) provide Layer 3 IP routing and QoS services. Customers must share IP addressing plans and mark QoS traffic sent across the access link. PE and CE routers

become routing peers, allowing the SP to perform route redistribution via MP-BGP. This ensures the correct customer routes are advertised to customer sites and allows the MPLS network to make the necessary traffic forwarding decisions.

7.2 RFCs 6004/7387 Metro Ethernet (MetroE) WANs

MetroE encompasses a set of common Ethernet WAN services defined by the MEF. SPs use MPLS networks and EoMPLS/VPWS/VPLS Layer 2 VPNs to build and maintain MetroE services. Customers connect to a local SP *Point-of-Presence* office via an Ethernet access link. A *User Network Interface* (UNI, RFC 6005) defines the standards used by the access link.

MetroE services operate at Layer 2 and are transparent to the customer; all CE equipment belongs to the same subnet and become routing peers. SP equipment forwards customer Ethernet frames based on their `Source/Destination MAC` and 802.1Q `VLAN ID` values. Customers must choose an *Ethernet Virtual Connection* (EVC), which determines the scope of customer site communication.

An *Ethernet Line* (E-Line) connects exactly two customer sites in a Point-to-Point EVC. These customer devices must belong to the same subnet to become routing peers. Multiple E-Lines can terminate at the same customer interface, each using a unique subnet and 802.1Q `VLAN ID`. This enables many E-Lines to share the same access link.

An *Ethernet LAN* (E-LAN) connects multiple customer sites in a Full Mesh EVC. These customer devices must reside in the same subnet to become routing peers. An E-LAN is much more practical than using $\frac{n(n-1)}{2}$ separate E-Lines.

An *Ethernet Tree* (E-Tree) connects an *E-Tree Root* (a central site) to multiple *E-Tree Leafs* (remote sites) in a Point-to-Multipoint EVC. Each E-Tree leaf can send frames only to the E-Tree root, while the E-Tree root can send frames to all E-Tree leafs. This is optimal when an E-LAN is not required.

8 Appendix

Table 8.1: Protocol Timers

Protocol	Timer	Default Value
MAC Table	Aging-Time	300 s
STP	Hello	2 s
	Forward Delay	15 s
	Max Age	20 s (10∗ `Hello`)
RSTP	Hello	2 s
	Max Age	6 s (3∗ `Hello`)
CDP	Update	60 s
	Hold	180 s (3∗ `Update`)
LLDP	Send	30 s
	Hold	120 s (4∗ `Send`)
Errdisable	Recovery	300 s
Port Security	Aging	300 s
OSPF	Hello	10 s
	Dead	40 s (4∗ `Hello`)
	LSA Age	30 mins per-LSA

Table 8.2: Protocol Priority Values

Protocol	Priority	Default Value
STP/RSTP	0 - 61,440	32,768
OSPF	0 - 255	1
HSRP	1 - 255	100
VRRP	1 - 254	100
NTP	1 - 15	8

Note: The MAC Table is also referred to as the *Forwarding Information Base* (FIB) or *Content Addressable Memory* (CAM) table.

Table 8.3: Cisco Encryption Algorithms

Type	Algorithm	Salt	Secure?
0	cleartext		**NO**
4	PBKDF2-SHA-256		**NO**

8.2 Cisco IOS Configuration Examples

Layer 2 Interface Configuration

```
configure terminal
  interface F0/1
    mac-address MAC
    bandwidth KBPS
    duplex {half | full | auto}
    speed {MBPS | auto}
    description TEXT

show interfaces [INT] [status | switchport]
```

VLAN Configuration

```
configure terminal
  vlan VLAN_ID
    name TEXT
    [no] shutdown
  [no] shutdown vlan VLAN_ID
  interface F0/1
    switchport trunk encapsulation {dot1Q | isl | negotiate}
    switchport mode {trunk | dynamic {desirable | auto}}
    switchport nonegotiate
    switchport trunk allowed vlan VLAN_LIST
    switchport trunk native vlan VLAN_ID
    [no] shutdown
  interface range F0/2 - 12
    switchport mode access
    switchport {access | voice} vlan VLAN_ID
    [no] shutdown
  vtp mode {server | client | transparent | off}
  vtp domain TEXT
  vtp password PASSWORD
  [no] vtp pruning
  vtp version 2

show interfaces [INT] [status | switchport | trunk]
show vlan brief
show vlan id VLAN_ID
show vtp {status | password}
```

CDP / LLDP Configuration

```
configure terminal
  [no] {cdp | lldp} run
  {cdp | lldp} timer SECS
  {cdp | lldp} holdtime SECS
  [no] cdp advertise-v2
  interface range F0/2 - 12
    [no] cdp enable
    [no] lldp {transmit | receive}

show {cdp | lldp}
show {cdp | lldp} traffic
show {cdp | lldp} interface [INT]
show {cdp | lldp} neighbors [detail] [INT]
show {cdp | lldp} entry NEIGHBOR
```

Spanning Tree Configuration

```
configure terminal
  errdisable recovery cause bpduguard
  spanning-tree mode {pvst | rapid-pvst | mst}
  spanning-tree pathcost method {long | short}
  spanning-tree [vlan VLAN_ID] root {primary | secondary}
  spanning-tree [vlan VLAN_ID] priority {32768 | 28672 | 24576 | ...}
  spanning-tree portfast [edge | network] [bpduguard | bpdufilter] default
  spanning-tree loopguard default
  interface Po1
    spanning-tree [vlan VLAN_ID] cost PORT_COST
    spanning-tree [vlan VLAN_ID] port-priority PORT_PRIO
    spanning-tree [vlan VLAN_ID] link-type {point-to-point | shared}
    spanning-tree portfast [disable | [edge | network] [default | trunk]]
    spanning-tree {bpduguard | bpdufilter} {enable | disable}
    spanning-tree guard {root | loop | none}

show spanning-tree [bridge | summary]
show spanning-tree [vlan VLAN_LIST | interface INT]
```

Link Aggregation Configuration

```
configure terminal
  port-channel load-balance {src-mac | dst-mac | src-dst-mac | src-ip | dst-ip
     > | src-dst-ip | src-port | dst-port | src-dst-port}
  interface range F0/13 - 16
    [no] switchport
    [no] shutdown
    channel-group 1 mode {on | desirable | auto | active | passive}
  interface Po1
    [no] switchport
    [no] shutdown

show etherchannel [CHANNEL] {summary | port-channel}
show etherchannel load-balance
test etherchannel load-balance interface INT mac SRC_MAC DST_MAC
```

Authenticated NTP Configuration

```
configure terminal
  clock timezone CST -6 0
  clock summer-time CDT recurring 2 SUNDAY MAR 02:00 1 SUNDAY NOV 02:00
clock set HH:MM:SS DATE MONTH YEAR
clock {update-calendar | read-calendar}

WLC WLAN Configuration

1. Create a new WLC Dynamic Interface:
   - `Name` (31 or fewer ASCII characters)
   - `VLAN ID` (Integer value 1-1001, 1007-4094 inclusive)
2. Create a new WLC WLAN:
   - `Profile Name` (32 or fewer ASCII characters)
   - `SSID` (32 or fewer ASCII characters)
   - `WLAN ID` (Integer value 1-512 inclusive)
3. Configure the new WLAN:
   - Bind the Dynamic Interface to the WLAN.
   - Enable the WLAN on the WLC.
   - Enable broadcasting of the WLAN SSID by APs.
4. Secure the new WLAN:
   - Set `Layer 2 Security` to **WPA+WPA2**, enabling the `WPA2` checkbox.
   - Set `WPA2 Encryption` to **AES/TKIP/CCMP/GCMP**.
   - Enable the `PSK` checkbox.
   - Set the `PSK Format` to **ASCII** and enter the PSK value.
